UNLOCK THE EVIDENCE

Quick access without the need for backward engineering or hacking a biometric device

Digital security and biometrics, although essential for personal privacy and prevention of crime, are at times a roadblock to major investigations needing to access critical evidence.

The AFPR 2000 uses proprietary technology to recreate a suspects fingerprint onto an advanced film allowing investigators to unlock most biometric enabled devices such as mobile phones, laptops and access control systems.

Fingerprints taken from a suspect or already stored in a national fingerprint database can be imported into the AFPR 2000 software. The suspect fingerprint is reproduced onto specialist film at a 1:1 ratio enabling accurate reproduction allowing investigators to access biometrically secured devices
