

Shadow™ 3

Breakthrough Computer Forensic Analysis Device

Patented State-of-the-Art Technology

The Shadow Paradigm™

Re-think standard forensic practices, make the shift to The Shadow Paradigm.

View suspect computers in **real time** at the scene of the investigation without prior need to image HDDs.

Eliminate the need for clumsy virtual viewing software.

100% Forensically Sound - **zero risk** of corrupting the evidence.

Shadow Paradigm and technology is in use by U.S. and Worldwide Justice Agencies, Local Law Enforcement and the Private Sector.

Break Down The Suspect

Clearly show the suspect and legal advisor any portion of the evidence. The legal position will be understood quickly and an admission of guilt can be vigorously encouraged.

Break Apart Legal Tactics

Don't let the evidence be obfuscated. There is no need for extensive education of the layperson. Simply present the judge and jury **exactly** what the suspect would have viewed **on the suspect's own computer** – and leave no doubt in their minds.

Evidence Beyond the Shadow of a Doubt!™

Streamline Evidence Acquisition

Operate and investigate suspect hard drive (HDD) in the field at the crime scene in minutes, ***prior to imaging***. With ever increasing HDD sizes the time savings in prioritizing the order of HDDs to image or even eliminating the need to image certain HDDs at a multi HDD capture site becomes paramount.

ShadowSpeed!TM

Forensically Safe Real Time Investigation

The Shadow provides read/write access from the host computer's perspective, while maintaining the original HDD unchanged and forensically sound. The Shadow redirects all writes to its internal drive, at the host-to-drive interface level. Clear ('zero') the Shadow's drive at anytime and begin a clean investigation of the suspect computer within seconds.

ShadowSecure!TM

Shadow a SATA Drive

Shadow an IDE Drive
