

The Shadow Knows

Acting as a drive cache between the motherboard and drive, the Shadow enables forensically safe ***booting and operation**** of the suspect computer/computing device

- The Shadow works with any/all operating systems and software, ***just as hard drives work with even new operating systems and software applications***
- Forensically sound, repeatable, accepted in court

* Shadow enables operation of any system that is *mutually* compliant with the Shadow on the ATA/PI bus (SATA/IDE).

Shadow is in use by U.S. and Worldwide Justice Agencies, Local Law Enforcement and the Private Sector.

Investigate Many Suspect Devices

Patented State-of-the-Art Technology

- PC Workstations
- Laptops
- Game Consoles (Xbox, PS4, etc)
- DVR's
- Video Security Systems
- RAID (one shadow required for each drive)

Evidence Beyond the Shadow of a Doubt!™

Uniquely valuable from triage, to the lab, to court prep and presentation

- **Triage** *on site, in the lab*
- **Immediate investigation**, *e.g. abductions*
- **When software tools fail** (*encryption*, RAID, game consoles, DVR's, unsupported file types*)
- **Malware investigation**
- **Evidence presentation****

*If some folders or drives are encrypted via Windows encryption, or 3rd party encryption schemes, but automatically decrypted upon user login, use of the Shadow enables the suspect computer to decrypt those files for you.

** From screen shots, to active screen capture, to live presentations in court or in front of the suspect to compel a plea

Shadow a SATA or IDE Drive

Forensically Safe Real Time Investigation

The Shadow provides read/write access, while maintaining the original HDD unchanged and forensically sound. The Shadow redirects all writes to its internal drive, at the host-to-drive interface level. Clear ('zero') the Shadow's drive at anytime.
